Application No.: 10/603,670 Docket No.: M4065.0457/P457-B

## **AMENDMENTS TO THE SPECIFICATION**

[0028] Referring to the drawings, where like elements are designated by like reference numerals, Figure 1 illustrates a ternary phase diagram 200 showing glass forming regions for (Ge<sub>x</sub>Se<sub>1-x</sub>)<sub>1-y</sub>Ag<sub>y</sub> compounds (i.e., regions in the phase diagram where (Ge<sub>x</sub>Se<sub>1-x</sub>)<sub>1-y</sub>Ag<sub>y</sub> compounds exist in the glass phase), as studied by Mitkova et al. in *Dual Chemical Role of Ag as an Additive in Chalcogenide Glasses*, Phys. Rev. Letters, Vol. 83, No 19 (Nov. 1999), the disclosure of which is incorporated by reference herein. According to Mitkova et al. and as shown in Figure 1, ternary (Ge<sub>x</sub>Se<sub>1-x</sub>)<sub>1-y</sub>Ag<sub>y</sub> glasses which comprise germanium selenide glasses with silver (Ag) as an additive form in two distinct compositional regions: a selenium-rich region labeled region I (Figure 1) and a germanium-rich region labeled region II (Figure 1). As also shown in Figure 1, a corridor 88 separates the selenium-rich region I from the germanium-rich region II. Mitkova et al. mentions that no bulk glass formation occurs along the corridor 88 until the silver (Ag) concentration exceeds y≥0.2 and the two selenium-rich and germanium-rich regions I and II coalesce.
